

Exacq

Integration with exacqVision VMS delivers a robust and highly adaptable video monitoring solution.

KEY FEATURES

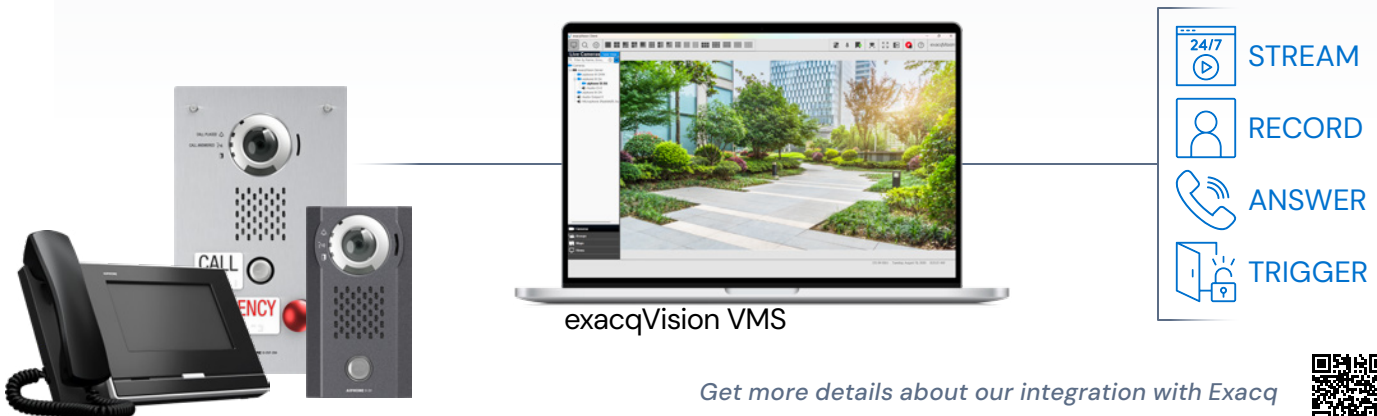

- ✓ View and record live audio and video from intercoms in exacqVision
- ✓ Answer intercoms and speak with visitors from the exacqVision client
- ✓ Trigger door release and other relays during any active calls

The combination of Aiphone's IX|IXG Series intercoms with Exacq's exacqVision Video Management System creates a truly unified security solution. Operators can monitor, communicate, and control intercoms via the exacqVision client with no additional software or hardware required.

Aiphone stations stream live audio and video to exacqVision, where they can be monitored and recorded alongside existing IP cameras. This gives operators a complete view of activity at every entry point, all from one platform.

When an intercom call is initiated, two-way audio allows operators to answer them and speak with visitors in real time directly in exacqVision. During the call, door release and other onboard relays can be triggered through its I/O control. Access can be granted or connected devices can be activated without missing a beat.

By bridging the gap of monitoring, communication, and door entry into a single platform, Aiphone and exacqVision give security teams a faster, simpler way to manage entry points.
