# Unify Communication and Access Control with the Powerful Integration Between Aiphone and Inner Range

Aiphone's IX|IXG Series can be integrated with Inner Range's Intelligent Management Software (IMS) to deliver centralized monitoring and control from a single platform, bringing intercom activity directly into the operator's existing security workflow.

Intercom events are received by the IMS platform in real time and can be used to automatically trigger actions, activate inputs, control entities, and generate alerts within the software. Calls are logged for a complete activity record while associated camera footage displays the moment an event occurs, giving operators immediate visual context. IMS managed doors can be unlocked in response to intercom activity, allowing fast and confident access decisions.

Device status and state of each intercom (online, offline, alarm, or call) are always visible to the operator. Intercoms can be associated with IMS entities and are viewed and controlled in interactive maps, providing a real-time picture of intercom activity alongside the rest of the security system, all through a unified, single pane of glass.

## KEY FEATURES

**Event-Driven Automation** – Log and use intercom events to automate actions and respond instantly without manual intervention.

**Live Status Monitoring** – Operators can see each intercom's connection state: online, offline, alarm, or call.

**Monitor and Control** – When an intercom event occurs, associated camera footage is displayed and doors can be unlocked directly from the IMS.

**Device Mapping** – Intercoms can be associated with site entities and can be viewed and controlled on interactive maps.
