

Eliminate Network Barriers to Reduce Cost, Risk, and Disruption

KEY FEATURES

- ✓ Leverage existing cable
- ✓ Reduce deployment complexity
- ✓ Deliver power and data
- ✓ Minimize downtime and disruption

Organizations looking to modernize their intercom systems often face a common roadblock: network readiness. They're told an entire replacement of their existing infrastructure is required due to lack of reach or cabling limitations. This increases costs, adds complexity, and creates disruptions—especially in historical or high-security environments where changes are not easily performed.

Through our partnership with NVT Phybridge, these barriers are eliminated. Customers can reuse existing 2-wire or UTP cabling infrastructure to deploy modern Aiphone IP intercom solutions faster, more cost-effectively, and with less interference to daily operations.

With Aiphone and NVT Phybridge, our integration partners can:

- Extend IP connectivity well beyond traditional switch limitations to support larger or more complex environments.
- Shift budget towards more devices, integrations, and applications that enhance the overall solution.
- Simplify deployments in challenging environments where new cabling is impractical or restricted.
- Unlock new opportunities by removing infrastructure constraints that typically delay projects.
