

Aiphone's IX|IXG Series and VIVOTEK's VSS unite intercoms and video management for faster, smarter security responses.

KEY FEATURES

- ✓ **Monitor cameras and intercoms in one centralized platform**
- ✓ **Stream and record video and one-way audio from IX|IXG intercoms**

Integration between Aiphone's IX|IXG Series intercoms and VIVOTEK's VSS (VAST Security Station) video management system provides a unified and efficient way to monitor and manage security. By streaming live video and one-way audio from IX|IXG stations directly into VSS, security teams get complete visibility across both intercom and camera systems in a single, centralized platform.

This streamlined approach reduces complexity, eliminates the need to switch between applications, and enhances situational awareness while helping security

and IT leaders respond faster and more effectively. Ideal for enterprise environments, campuses, and critical facilities, this solution allows organizations to leverage their existing VMS investment while extending coverage to entry and communication points.

With reliable integration and simplified management, dealers, integrators, and end users can deliver a cohesive security ecosystem that improves efficiency, strengthens incident response, and ensures facilities remain protected at every access point.
